

ILLUSTRATIVE SAMPLE / NO CLIENT DATA

Traustia Evidence Report

Evidence you can defend.

An illustrative review of a fictional high-dimensional biomarker model, demonstrating how provenance, analytical integrity, validation, uncertainty, and claim boundaries can be documented.

01 / EXECUTIVE REVIEW

Evidence state: conditional support.

The fictional model shows a reproducible analytical signal, but the strongest decision claim remains constrained by validation design and cohort transportability.

DATA

Traceable

Source cohort and preprocessing path are documented. Independent provenance verification remains required.

METHOD

Reviewable

The model path can be reconstructed. Feature selection must remain nested inside evaluation.

VALIDATION

Incomplete

External performance, calibration, and subgroup behavior remain decision-limiting.

DECISION BOUNDARY

Supported

The analytical workflow produces a repeatable signal within the illustrative source cohort.

Not yet supported

Clinical utility, general population performance, and transportability beyond the reviewed context.

PRIORITY ACTIONS

01 Repeat model selection within a fully nested validation design.

02 Evaluate calibration and decision thresholds in an independent cohort.

03 Pre-specify subgroup and missing-data sensitivity analyses.

02 / PROVENANCE REVIEW

Every result inherits the history of its data.

This page demonstrates how an evidence report can trace origin, transformation, inclusion rules, missingness, and unresolved provenance questions.

TRACEABILITY CHECKS

● Cohort definition	DOCUMENTED
● Inclusion and exclusion logic	REVIEW REQUIRED
● Transformation versions	DOCUMENTED
● Missing-data mechanism	UNRESOLVED
● Outcome availability	DOCUMENTED

OPEN QUESTION

Selection pathway

Confirm whether exclusions were determined before outcomes and model performance were reviewed.

EVIDENCE REQUIREMENT

Immutable trace

Retain versioned code, data dictionaries, transformation logs, and analytical manifests.

03 / ANALYTICAL REVIEW

Performance is not credibility.

A defensible model requires separation between training and evaluation, transparent uncertainty, stability analysis, and controls against optimistic bias.

NESTED EVALUATION PATH

STABILITY REVIEW / ILLUSTRATIVE

04 / VALIDATION

The claim can travel only as far as the evidence.

External validation tests more than performance. It tests calibration, decision thresholds, subgroup behavior, data-generating context, and scientific transportability.

VALIDATION LADDER

TRANSPORTABILITY

Context map

Population, setting, assay platform, prevalence, treatment pathway, and decision threshold must be compared before extending the claim.

CLAIM BOUNDARIES

B01 A repeated signal is not automatically clinically useful.

B02 External discrimination does not guarantee calibration.

B03 Population shift can invalidate a fixed threshold.

B04 Biological plausibility does not replace independent validation.

05 / CONCLUSION

A defensible conclusion includes its limits.

The report closes by separating what the reviewed evidence supports from what remains uncertain, and by specifying the work required before a stronger decision claim is justified.

ILLUSTRATIVE EVIDENCE STATEMENT

The model signal is analytically repeatable within the reviewed source context. Independent validation and decision-utility evidence are required before broader use.

DELIVERABLE CONTENTS

- Claim and decision context
- Integrity and reproducibility review
- Uncertainty and contradiction log

- Data provenance and analytical trace
- External validation assessment
- Decision boundary and next actions

IMPORTANT

This document is a fictional design sample. It contains no client, patient, institutional, or unpublished research data. It is not medical advice, regulatory certification, or a substitute for project-specific scientific review.
